Andrew Plaza

Systems Engineer

insipx.xyz
GitHub: insipx
LinkedIn: andrewplaza1

Systems engineer with 7+ years of Rust. Built streaming, storage, and APIs used in performance-sensitive distributed environments.

SKILLS

Tools and Languages	Rust, Nix/NixOS, K3S, gRPC, PostgreSQL, FFI, SQLite, OpenTelemetry, MLS
Languages	English, Polish

TECHNICAL EXPERIENCE

Staff Software Engineer / Rust - Systems & Runtime Infrastructure

OCT 2023 — SEP 2026

XMTP Labs

Remote (Philadelphia, PA)

- Architect and owner of [libxmtp](#), a Rust library for end-to-end encrypted group messaging and agent backends supporting 1M+ messages daily.
- Made libxmtp viable server-side at thousands of clients per host, cutting per-instance memory 3x and eliminating millions of idle queries per hour, which unblocked the Convos backend orchestrating thousands of LLM agents.
- Onboarded 4 new engineers to libxmtp and mentored a team of 8 across the Rust codebase, MLS implementation, and gRPC backend.
- Created [sqlite-web-rs](#), a WebAssembly SQLite backend for Diesel that brought the full Rust stack to browsers.
- Owned the libxmtp release pipeline with Nix-based reproducible cross-compilation to iOS, Android, WASM, and Node for 8 downstream SDKs. Fully automated weekly mobile releases with ephemeral builds and TestFlight submission.
- Built [xdbg](#), a cross-version compatibility CI to catch regressions before reaching partners. Caught a wire-format bug that could have caused a significant network outage.
- Designed and built the centralized-to-distributed migration, which included vector-clock causal ordering and an ephemeral test-network orchestrator ([xnet](#)) to validate it under network chaos.

Rust Blockchain Developer / Efinity

FEB 2022 — OCT 2023

Enjin

Remote (Philadelphia, PA)

- Developed Substrate implementations for fungible and non-fungible tokens and currencies.
- Designed and implemented cross-chain message passing to enable interoperability with 30 other parachains.
- Authored documentation for 30+ indie and AAA gaming partners.

Rust Software Developer / Tools - Substrate

NOV 2018 — MAR 2022

Parity Technologies

Remote (Berlin, DE / Philadelphia, PA)

- Owned [Substrate Archive](#), a generic indexing tool built with Rust and PostgreSQL compatible with 100+ Substrate blockchains and indexing 1TB+ of chain data.
- Created [Desub](#), a decoder that turns raw bytes into typed, human-readable data using a Substrate chain's runtime metadata.
- Built [dot-jaeger](#) to collect thousands of metrics per second into Grafana, enabling observability for parachain teams.
- Contributor to [jsonrpsee](#) a Rust JSON-RPC implementation, and [subxt](#) a REST API sidecar to Substrate.

PROJECTS

jupiter — Bare-Metal NixOS Fleet

github.com/insipx/jupiter

- Homelab rack (Raspberry Pi 5s + x86 nodes) in one Nix flake. K3S, custom ARM kernels, ZFS, fleet-wide deploys, and macOS remote Nix builders.

PRESENTATIONS

wen group chat web

2024

XMTP

EDUCATION

Bachelor of Science in Computer Science, University of Scranton

MAY 2019
